

**READ ME**

This document describes the logic used for the "Automated Status" fields. These fields are used to determine what status the entity is in and linked to an automation which will update the "Status" field to the correlated value.

"Automated Status" field is meant to only be an internal value and is hidden from the interfaces. "Status" field is meant to be an at-a-glance overall status of the associated entity.

These logic flows are mant to be read left-to-right, which reflects the order that the logic is evaluated in Airtable.
